

Extracting Emergent Semantics from Large-Scale User-Generated Content

Yiannis Kompatsiaris

Informatics and Telematics Institute

Centre for Research and Technology - Hellas

<http://mklab.itι.gr>

Contents

- Introduction
- Emergent Semantics from Social Media
 - Opportunities and Challenges
 - Applications
- Community detection in Social Media
 - clusttour.gr application
- Social media “teacher” of the machine
- WeKnowIt project
- Conclusions - Issues

Web 2.0 content (July 2010)

flickr

- 3,190 uploads in the last minute
- 3.2 million things geotagged this month
- 4,754,012,299 photos (2 July 2010)

YouTube

- 24h of video content uploaded every minute
- 2 billion movies watched every day

facebook

- More than 400 million active users
- More than 200 million users log on at least once each day
- 2.5 billion photos uploaded each month

Winner

The winner of the WeKnowIt Grand Travel Challenge

Social networks and media

- Users upload, tag, share, connect and search
- Emphasis is on uploading, visualization of results and interfaces
- Single media item analysis
- Limited usage of the **Collective nature** of Social Networks

Two main directions

- 1. Improve access to social media
 - Tag refinement, suggestion, propagation
- 2. Extract **implicit** information, capture emergent semantics
 - Not explicitly identifiable by users
 - Data mining
 - Collective Intelligence

Can we improve things?

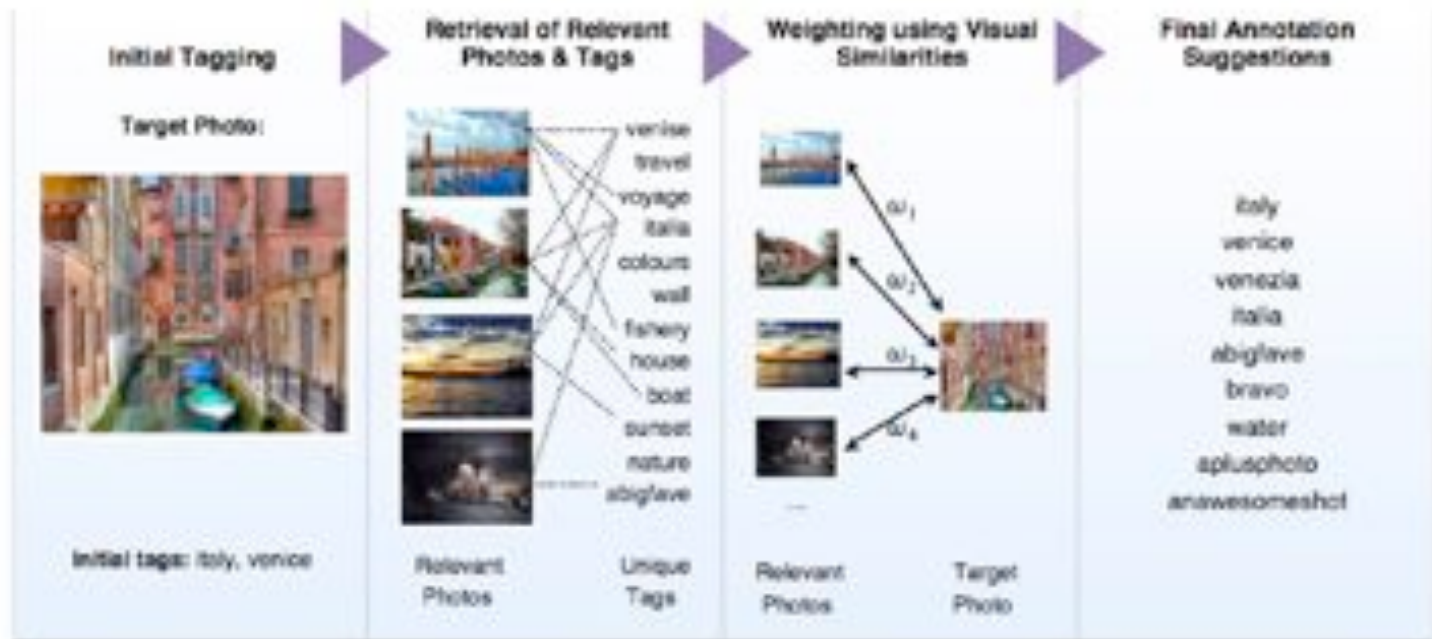

The screenshot displays a search interface with a 'Search' bar at the top. Below the search bar, there are tabs for 'Photos', 'Groups', and 'People'. A 'SEARCH' button is visible, along with options for 'Full Text' and 'Tags Only'. The main content area is titled 'Tag Clusters' and lists three clusters of photos based on tags:

- Photos with tags like nyc, newyork and manhattan
- Photos with tags like fruit, red and green
- Photos with tags like ipod, iphone and music

Below the clusters, there are several photo thumbnails with their respective sources. The sources include: From sonnyhung, From War, From (karen), From HAZEL- S. b. G. B., From amy johanna, From nrvica, From fernando780, From jordanmeric..., and From humedini. The interface also shows sorting options like 'Sort: Relevant', 'Recent', and 'Int', and view options like 'Small', 'Medium', 'Detail', and 'Slideshow'.

By combining information from many photos - tags, it seems that we can
Stable patterns
in tagging systems over time

Tag refinement, suggestion, ranking

Social Networks and Collective Intelligence

- Social Networks is a data source with an extremely dynamic nature that reflects events and the evolution of community focus (user's interests)
- Potential for much more if we mine the data and their relations and exploit them in the right context
 - Scalable approaches taking into account the content and social context of social networks
- Search and Discovery of meaningful topics, entities, points of interest, social connections and events
- Rather than search for **isolated** or directly connected **social media items**

Extraction of implicit information

trace Flickr users from a chronologically ordered set of geographically referenced photos

Who are the Italians and who are the Americans?

MIT SENSEABLE CITY LAB, "The World's eyes"

What else we can do?

Tags that are “representative” for a geographical area

- 1. Clustering of photos
 - K-means, based on their location [Kennedy07]
- 2. Rank each cluster's tags
- 3. Get tags above a certain threshold

Contribute to our understanding of the world

Representative tags for San Francisco [Kennedy07]

Sensors and automatically user generated content

Uses the GPS in cellular phones to gather traffic information, process it, and distribute it back to the phones in real time

- online, real-time data processing
- privacy-preservation
- data efficiency, i.e. not requiring excessive cellular network

Mobile Century Project: <http://traffic.berkeley.edu/mobilecentury.html>

Social Media as real-time Sensors

“...if you're more than 100 km away from the epicenter [of an earthquake] you can read about the quake on twitter before it hits you...”

Web 2.0 Content and Challenges

- **Multi-modality:** e.g. image + tags, image + video
- **Rich Social Context:** spatio-temporal, social connections, relations and social graph
- **Inconsistent quality:** noise, spam, ambiguity
- **Huge volume:** Massively produced and disseminated
- **Multi-source:** may be generated by different applications, user communities, e.g. delicious, StumbleUpon and reddit are all social bookmarking sites
 - Also connected to other sources (e.g. LOD, web)
- **Dynamic:** Fast updates, real-time

collective intelligence

...a form of intelligence emerging from online user activities

Collective Intelligence >> sum of individuals' intelligences

Research Fields and Issues

- Statistical analysis, machine learning, data mining, pattern recognition, social network analysis
 - Clustering
- Representation, modeling, data reduction, graph theory
- Image, text, video analysis
- Information extraction
- Fusion techniques
- Stream processing and real-time architecture
- Trust, security, privacy
- Performance, scalability
 - speed, storage, power, grids, clouds

Applications

Xin Jin, Andrew Gallagher, Liangliang Cao, Jiebo Luo, and Jiawei Han. **The wisdom of social multimedia: using flickr for prediction and forecast**, International conference on Multimedia (MM '10). ACM.

Figure 7: Keuters/Zogby Poll v.s. Flickr. Y-axis denotes the percentage of popularity for candidate Edwards.

Federal Emergency Management Agency **plans to engage the public** more in disaster response by sharing data and leveraging reports **from mobile phones and social media**

Gogobot: Travel Discovery Goes Social And Visual "The service raised \$4 million in funding (Google CEO Eric Schmidt is one of the investors)...This is a \$100 billion a year industry in the U.S. It's something like \$350 billion worldwide."

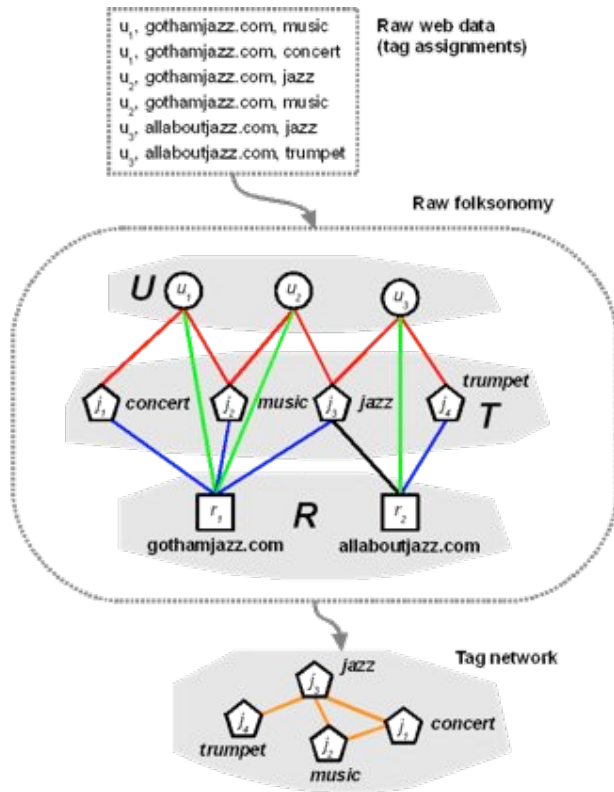

Applications

- Science
 - Sociology, machine learning (machine as a teacher), computer vision (annotation)
- Tourism – Leisure – Culture
 - Off-the-beaten path POI extraction
- Marketing
 - Brand monitoring, personalised ads
- Prediction
 - Politics: election result
- News
 - Topics, trends event detection
- Others
 - Environment, emergency response, energy saving, etc

Social Media Community Detection

Examples of Social Media networks

Folksonomy (Delicious)

Mika, P. (2005) Ontologies Are Us: A Unified Model of Social Networks and Semantics. Proceedings of the 4th International Semantic Web Conference (ISWC 2005), Springer Berlin / Heidelberg, pp. 522-536

MetaGraph (Digg)

Lin, Y., Sun, J., Castro, P., Konuru, R., Sundaram, H., and Kelliher, A. (2009) MetaFac: community discovery via relational hypergraph factorization. Proceedings of KDD '09, ACM, pp. 527-536

What is a community in a network?

Group of vertices that are more densely connected to each other than to the rest of the network.

Multiple definitions to quantify communities:

Fortunato S. (2010) Community detection in graphs. Physics Reports 486: 75-174

Global: N-cut, conductance, modularity

Local: Local modularity, (μ, ϵ) -cores

Ad hoc: Label propagation, dynamic synchronization

Related to clustering, but: (a) not necessary to know number of communities, (b) computationally more efficient

In Social Media, we focus on local definitions, because of the properties of Social Media networks: efficiency-scalability and noise resilience.

Challenges in Social Media network mining

No prior assumptions about structure:

Complex & evolving structure

No possibility for knowing structural features (e.g. number of clusters on a graph) in advance

→ Unsupervised

Scale

Tens of millions of active users frequently contributing loads of content links + metadata (tags, comments, ratings)

→ Efficient - scalable

Quality

Spam is very common. Only a portion of user contributions is worth further analysis.

→ Noise resilient

Approach illustration (1/2)

Two-step process:

- 1st step:
 (μ, ε) – core detection
- 2nd step:
Local expansion
- 3rd step:
Characterization of remaining vertices as *hubs* or *outliers*

Approach illustration (2/2)

- Structural similarity + Local expansion
(highly efficient and scalable approach)
- Not necessary to know the number of clusters
- Noise resilient
(not all nodes need to be part of a community)
- Generic approach adaptable to many applications
(depending on node – edge representation)

S. Papadopoulos, Y. Kompatsiaris, A. Vakali. "A Graph-based Clustering Scheme for Identifying Related Tags in Folksonomies". In Proceedings of DaWak'10, Springer-Verlag, 65-76

Social Media “teacher” of the machine

Exploiting clustering for machine learning

Objective: Develop a framework able to create strongly annotated training samples from weakly annotated images

Tagged images

sand, wave, rock, sky

sea, sand

sand, sky

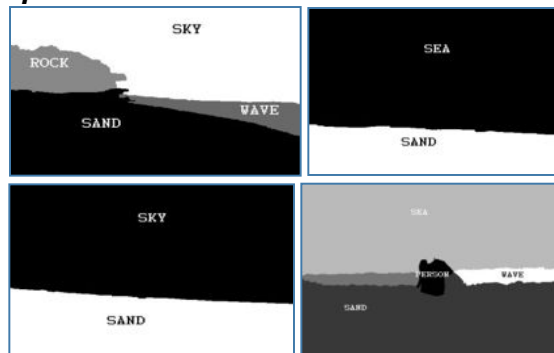

person, sand, wave, sea

Social information +

Image analysis

Region-detail annotated

[Chatzilari09]

Machine Learning

Object Detectors

Solutions:

- ❖ Exploit user tagged images from social sites like flickr
- ❖ Combine techniques operating on tag and visual information space

Step 1: Process image tag information in order to acquire image groups each one emphasizing on a particular object.

Step 2: Pick an image group so as its most frequent tag to conceptually relate with the object of interest.

sand, wave, rock, sea

sea, sand

sand, sky

person, sand, wave, sea

Step 3: Segment all images in the selected image group into regions.

Step 4: Extract the visual features of these regions.

Step 5: Perform feature-based clustering so as to create groups of similar regions

Step 6: Use the visual features extracted from the regions belonging to the most populated cluster, to train a machine learning-based object detector.

Tag-based processing

[Giannakidou08]

SEMSOC, vector space model where each image is projected onto a space defined by the most prominent tags

SEMSOC output example

Distribution of objects based on their frequency rank

Absolute difference between 1st and 2nd most highly ranked objects increases as n increases

Segmentation & Visual Descriptors

- Segmentation

- K-means with connectivity constraint (KMCC)

[Mezaris et al., 2004]

- Visual Descriptors

- MPEG-7 standard

- *Dominant Color , Color Layout, Color Structure, Scalable Color, Edge Histogram, Homogeneous Texture, Region Shape.*

[Bober et al., 2001], [Manjunath et al., 2001].

Region-based Clustering & Cluster Selection

Region clustering

- ❖ Perform segmentation and visual feature extraction from all images in an image group (Identified by SEMSOC)

- ❖ Perform clustering based on visual features to gather together regions depicting the same object

- ❖ Pick the most populated cluster as the one representing the most frequently appearing tag of the group

Experimental Results – Cluster Selection

Setting:

- Visualise the way regions are distributed among clusters
- Use shape-code (squares) to indicate the regions of interest and color-code to indicate a cluster's rank (largest cluster: red)
- Ideally all squares should be painted red and all dots should be painted differently

Goal:

- Validate our theoretical claim that the most populated cluster contains the majority of regions depicting the object of interest

Conclusions:

- Our claim is valid in 5 (i.e., sky, sea, person, vegetation, rock) and not valid in 2 (i.e., boat, sand) cases

Vegetation in magnification

Experimental Results - Man. vs Autom. trained object detectors

Observations:

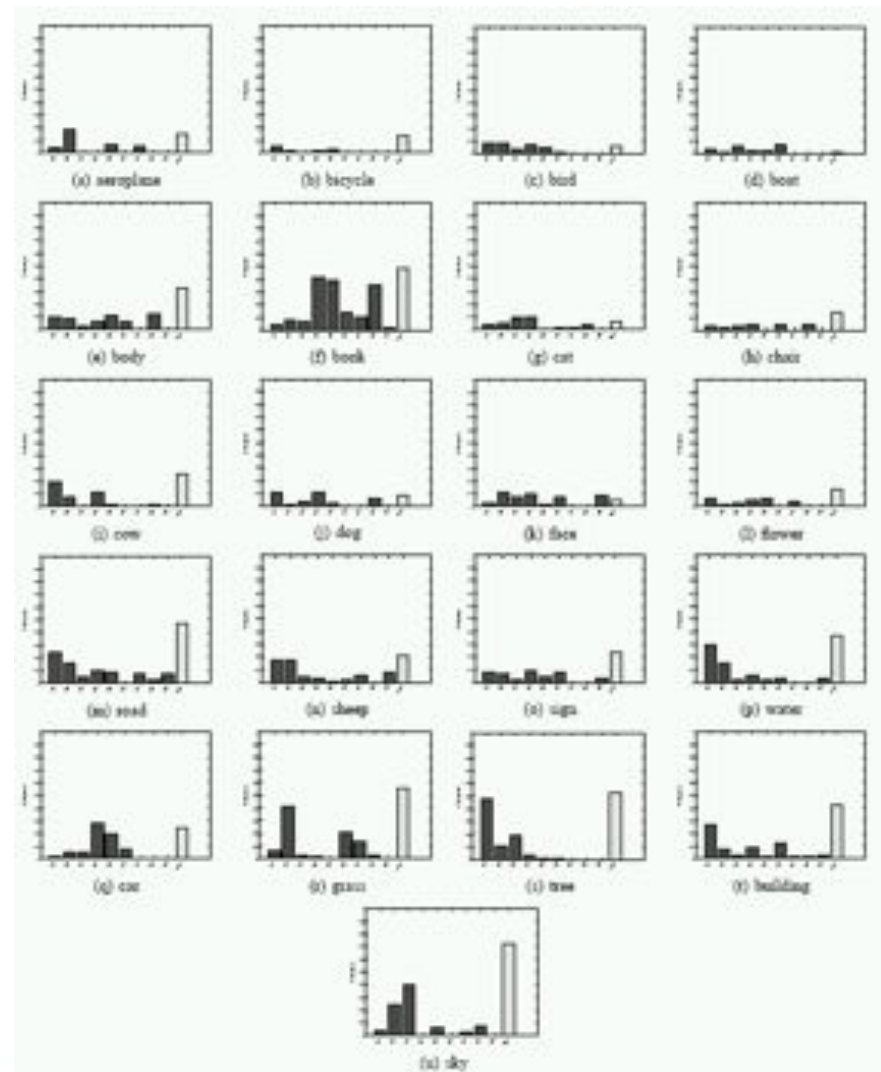

- Performance lower than manually trained detectors
- Consistent performance improvement as the dataset size increases

Experimental Results – MSRC Dataset (21 objects)

Observations:

- In 5 cases the objects were too diversiform to be described by the employed feature space (not even the manual annotations performed well)
- In 5 cases the annotation we got from Flickr groups were not appropriate
- In 6 cases, our method has failed to select the appropriate cluster
- In 5 cases our method worked well

Experimental Results - MSRC vs Flickr groups

Target object: Tree

Tree object

Good example: Semantic objects are correctly assigned to clusters and the most-populated cluster corresponds to the target object)

Experimental Results - MSRC vs Flickr groups

Target Object: Sky

Sky object

Bad example: Sky regions are split in many clusters and the most populated cluster contains noise regions

WeKnowIt and CI

 UNIVERSITÄT
KOBLENZ · LANDAU

<http://www.weknowit.eu>

Conclusions and Issues

- Social media data mining provides interesting results in many applications
- Not all data always available (e.g. User queries, fb)
- Real-time approaches
 - Efficiency of semantics and analysis
- Real fusion of information
 - not just sum of different analysis
 - formal framework and approach
 - representation
- Linking other sources (web, Linked Open Data)
- Applications and commercialization

Thank you!
